A DIAGNOSTIC BLOOD TEST FOR DETECTING THE RISK OF
AGGRESSIVE PROSTATE CANCER

Prostate Biopsy Decision Clarified...

**BETTER INFORMATION LEADS TO
CONFIDENT DECISIONS**

1 in 7 men will be diagnosed with prostate cancer in their lifetime.

Know your risk...

PROSTATE CANCER: INDOLENT VS. AGGRESSIVE

Prostate cancer is one of the most common cancers and a leading cause of cancer death in men. However, based on the type of prostate cancer, many men do not need treatment and can be managed more conservatively.

INDOLENT PROSTATE CANCER

Cancer cells grow slowly and generally stay within the prostate without spreading to other parts of the body. With this type of prostate cancer, most men live normal, full lives without treatment.

AGGRESSIVE PROSTATE CANCER

Fast growing cancer cells that spread to other parts of the body. This is the lethal form of the disease, but it is treatable if diagnosed early.

SCREENING FOR AGGRESSIVE PROSTATE CANCER

Prostate cancer screening is commonly done by using a Prostate Specific Antigen (PSA) blood test and/or a digital rectal exam (DRE). If prostate cancer is suspected a prostate biopsy may be performed.

There are some challenges with current prostate cancer detection methods:

- PSA does not distinguish between indolent (non-life-threatening) and aggressive (potentially lethal) forms of prostate cancer
- Approximately 75% of men undergoing a prostate biopsy are found to have no cancer or the indolent form of prostate cancer, while enduring the pain and possible complications associated with the biopsy procedure
- Many men not found to have aggressive prostate cancer by biopsy will in fact have aggressive prostate cancer

The diagnostic dilemma:

How to identify men's risk for aggressive, lethal prostate cancer?

The answer:

4Kscore®

WHAT IS THE 4KSCORE TEST?

The 4Kscore Test is a blood test to identify your individualized risk of aggressive, potentially lethal, prostate cancer using four prostate-specific blood biomarkers plus your personal clinical information.

DO YOU NEED A 4KSCORE TEST?

The 4Kscore Test is for men who have:

- An abnormal PSA test result and/or DRE
- An inconclusive MRI
- Any clinical findings suspicious for aggressive prostate cancer

4Kscore® 

A simple blood test that provides your personal risk for aggressive prostate cancer

Most men with abnormal PSA levels are candidates for the 4Kscore Test...

Talk to your doctor today to find out if the 4Kscore Test is right for you.

HOW DOES THE 4KSCORE TEST ASSIST YOUR PHYSICIAN?

By accurately determining your risk for aggressive prostate cancer, the 4Kscore Test assists your physician by identifying patients at risk for the lethal form of the disease and thereby in need of additional testing or biopsy.

WHAT DOES YOUR 4KSCORE TEST RESULTS MEAN?

Low Risk: Your probability of having aggressive, potentially lethal cancer is very low. Your doctor may wish to continue monitoring you.

Elevated Risk: Your urologist will evaluate the 4Kscore Test results in conjunction with additional clinical information and discuss with you the appropriate next steps.

HOW MUCH DOES A 4KSCORE TEST COST?

Coverage for all laboratory tests depends on your particular insurance company. For those who do not have insurance, or who choose to pay out-of-pocket, GenPath offers the 4Kscore Test at an affordable price. Ask your doctor's office front desk staff for more information.

Know your 4Kscore...

You have a lot of living to do!

4Kscore®

The 4Kscore blood test gives your personalized risk of aggressive prostate cancer prior to making a decision about getting an invasive procedure. It also categorizes your risk of aggressive prostate cancer metastasis for up to 20 years.

Talk to your physician today to find out if the 4Kscore Test is right for you.

IS THE 4KSCORE TEST RIGHT FOR YOU?

Ask your physician for more information about the benefits of the 4Kscore Test or visit

Prostate Cancer Foundation
www.pcf.org

The 4Kscore Test is Not Indicated in Men With:

- Previous diagnosis of prostate cancer
- Digital Rectal Exam (DRE) performed in the previous 96 hours before phlebotomy
- 5-alpha reductase inhibitor medication within previous 6 months
- Prostate procedure within the last 6 months
- Men younger than 40 or older than 80 years of age
